

You want an agent to trade USDC ↔ WETH while you sleep.

The risk isn't a rogue AI — it's **a wrong intent, optimized perfectly.**

TODAY YOU PICK ONE

- Approve every tx by hand → you miss the opportunity.
- Hand the agent your keys → you lose custody & control.
- Static limits can't tell "buy the dip" from "catch a crash."

INTENTOS — ALIGN AT EVERY LAYER

- | | |
|------------|---|
| INITIAL | Intent Builder compiles intent → a typed Constitution . |
| MECHANICAL | EIP-7702 enforces hard limits on every tx. |
| SEMANTIC | Watcher Agent re-reads intent & can only tighten. |

HOW IT WORKS · THE DEMO YOU'RE ABOUT TO SEE

Your intent becomes an agent that executes — **without ever holding your funds.**

CUSTODY

EIP-7702 attaches contract code to **your own EOA**. Funds never move — you keep self-custody.

AGENT KEY

Runtime holds a **session key** with **0 ETH** — it can *request* execution, never move money.

GAS

A **Relayer** fronts gas; it's repaid from an in-account **GasVault**. The agent has zero custody.

HARD GUARD

Contract checks every request: **token** · **amount** · **slippage** · **expiry** → inside = execute, outside = **revert**.

SEMANTIC GUARD

Watcher Agent reads on-chain evidence & can **tighten / freeze** — **never loosen.**

IntentOS · ETHGlobal NYC 2026 — next: live demo on Base mainnet

Only you can.
