ETHGLOBAL NYC · 2026

IntentOS

Turning vague human intent into
autonomous agents that **stay**
aligned — even while you sleep.

Autonomy without authority

THE PROBLEM

The risk isn't an evil AI.
It's a wrong intention, **optimized perfectly.**

2:14 AM · you're asleep

*"Grow my ETH
while I sleep."*

MAXIMIZE_ETH

>

optimized perfectly

→

missed what you meant

AI did not fail. It followed the instruction.

 **Approve everything**

Safe — but you miss the opportunity.

 **Hand over authority**

Autonomous — but you lose control.

THE THESIS

Autonomy without authority.

We compile your intent into a bounded agent — and align it at every layer.

① INITIAL

Intent Builder

Understands what you actually mean.

② MECHANICAL

EIP-7702

Enforces it on-chain, on every action.

③ SEMANTIC

Watcher Agent

Guards the meaning over time.

④ ECONOMY

Agent NFT

Portable, ownable autonomous identity.

Autonomous agents need alignment, not trust.

POSITIONING

Not an AI wallet.
An alignment & execution layer.

OTHERS

"How can we trust AI with permissions?"

INTENTOS

"Why should trust be required?"

NOW — LIVE — WATCH FOR THREE THINGS

- 1 Your intent becomes an **agent NFT**.
- 2 It **executes while you sleep** — you approve nothing.
- 3 A **Watcher** can tighten it — **but never loosen it**.

CLOSING

① Intent Builder

② EIP-7702

③ Watcher

④ Agent NFT

Separate intelligence from **authority.**

Autonomous agents don't need
your trust. They need to stay
aligned with what you meant.
