

You want an agent to trade USDC ↔ WETH while you sleep.

The risk isn't a rogue AI — it's **a wrong intent, optimized perfectly.**

THE PROBLEM · TODAY YOU PICK ONE

- Approve every tx by hand → you miss the opportunity.
- Hand the agent your keys → you lose custody & control.
- Static limits can't tell "buy the dip" from "catch a crash."

THE SOLUTION · ALIGN AT EVERY LAYER

- | | |
|------------------------------|---|
| INITIAL | Intent Builder — compile intent into a typed Constitution . |
| MECHANIC
AL | EIP-7702 — enforce hard limits on every tx, on your own EOA. |
| SEMANTIC | Watcher Agent — re-read intent over time; tighten-only. |

The agent executes on your behalf — **without ever holding your funds.**

COMPONENTS

Owner EOA

EIP-7702

Funds stay here. Contract code is delegated onto your own account.

ExecutionContract + Hard Guardrails

Typed limits: token · amount · slippage · expiry · freeze.

ExecutionGasVault

Owner-prefunded gas lane. Executor / Watcher lanes are separate.

Cloud Run Runtime + SessionKey

0 ETH

OpenClaw agent. Holds a request key (KMS), never fund custody.

Relayer + Watcher Agent

Relayer fronts gas; Watcher reads on-chain evidence; tighter Base mainnet

EXECUTION FLOW — PER TICK

- 1 **Executor** emits a signal: `swap 50 USDC→WETH` (no keys).
- 2 **Adapter** quotes + simulates → builds a **typed ExecutionRequest**.
- 3 **SessionKey (KMS)** signs the request digest — 0 ETH, can't send.
- 4 **Relayer** submits `(req, sig)` & fronts gas.
- 5 **Contract** verifies sig + Hard Guardrails → **inside: execute** / **outside: revert**.
- 6 **Settle** gas from **GasVault**; emit `EvidenceCommitted` for the Watcher.

Autonomous agents need **alignment**, not trust
